

How BlisterGuard® technologies add comfort and value to your fabrics

Footwear

BlisterGuard finishes, integrated into the high-impact toe and heel strike zones, reduce friction to help protect against hot spots, abrasion and blisters.

Apparel

BlisterGuard finishes minimize the friction caused by continuous strenuous activity to help prevent chafing, skin irritation, and the sores that frequently result.

Medical

BlisterGuard finishes in compression gear protect sensitive areas prone to irritation (as with diabetes and vascular disease), limiting pain and discomfort and helping reduce blisters, sores.

Sportswear

BlisterGuard finishes reduce friction in fabrics used in both air and water, increasing potential speed by reducing drag — especially important for athletes in competition.

BlisterGuard technologies reduce friction and add significant comfort to textiles of many kinds. This, in turn, adds significant value to the textiles.

BlisterGuard technologies also offer good moisture management properties and do not promote static electricity. And they

make high-compression articles of apparel easier to put on and remove.

Whitford makes the largest line of fluoropolymer coatings in the world. For more information, please contact Spencer Siegel of Whitford at 610-286-3500 or
